

The catalog is the dataset: one copy of each cloud, one label array per (cloud, project)

CATALOG

721 clouds, content-hashed
data/<key>.npz
previews/, index.json

cloud A

key = sha256(bytes)[:16]

cloud B

key = sha256(bytes)[:16]

cloud C

key = sha256(bytes)[:16]

PROJECT Gold247 · 6-class

ontology: 6 classes, locked
labels/proj_1/<key>.npy
models/proj_1.json
settings: active model

PROJECT Endplate · 2-class

ontology: 2 classes
labels/proj_2/<key>.npy
same clouds,
independent labels

SANDBOX (always present)

no ontology, no own labels
any model on any cloud
output = cloud-level layer
labels/layer:<model>/<key>.npy
+ _layer.json

MODELS (26 registered)

checkpoint + frozen class map
runnable in any project whose
ontology has its classes (by name)
best mIoU is the default

Every stroke is written atomically under the active namespace — no “save project” step, nothing lost by closing the app.
